

Intimate Partner Violence: Understanding research on risk & protective factors

Dr Pauline Gulliver & Dr Janet Fanslow
NZ Family Violence Clearinghouse

27 June 2016

Outline of presentation

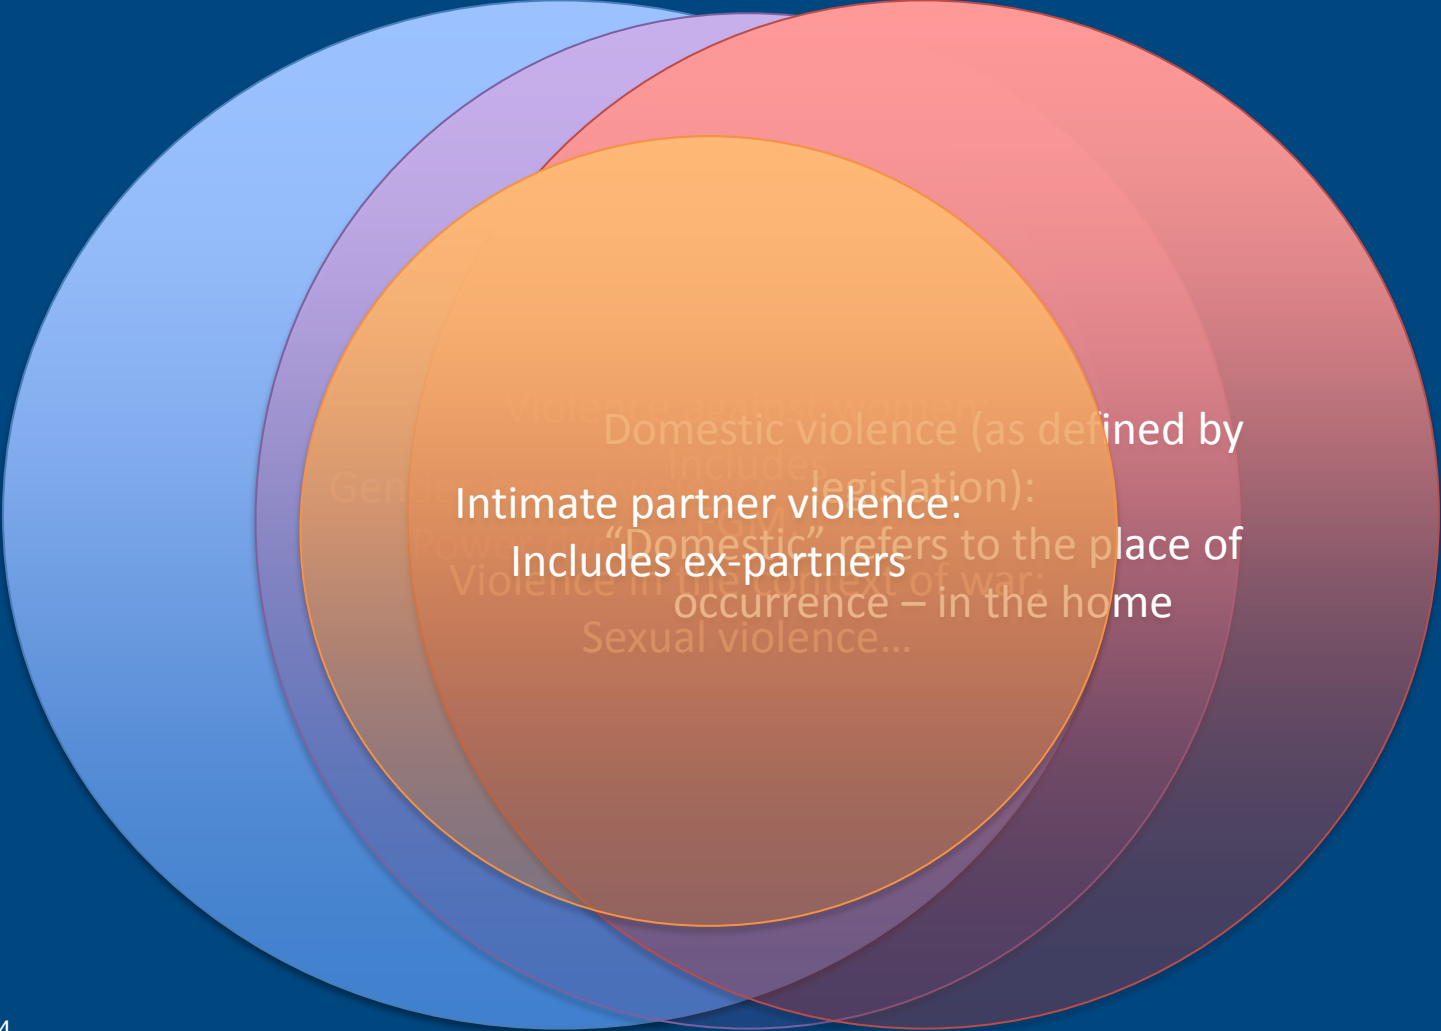

1. Definitions
2. The prevalence and impact of IPV
3. Conceptual models
4. Measuring risk and protective factors
5. Take home messages

Definitions

Getting on the same page: defining IPV

Domestic violence (as defined by
Intimate partner violence:
Includes ex-partners
“Domestic” refers to the place of
occurrence – in the home
Sexual violence...

Getting on the same page: defining “partner”

Getting on the same page: defining violence

Physical violence:

- Slapping
- Shaking
- Beating with fist or object
- Strangulation
- Burning
- Kicking
- Threats with knife or gun

Sexual violence:

- Coerced sex through threats or intimidation
- Coerced sex through physical force
- Forcing unwanted sexual acts
- Forcing sex in front of others
- Forcing sex with others

Emotional abuse:

- Constant belittling, humiliating
- Deliberately scaring or intimidating
- Threats of violence

Controlling behaviours:

- Isolation from others
- Excessive jealousy
- Monitoring whereabouts and social interactions
- Control her activities, access to health care, work...

The prevalence and impact of violence

Intimate partner violence fatalities

On average, nine women every year are killed by an intimate partner

If NZ was a country with 100 women...

33 would have experienced **physical**
or **sexual** intimate partner violence in
her lifetime.

If NZ was a country with 100 women...

55 would have experienced at least
one form of intimate partner violence
in her lifetime.

The health impact

The co-occurrence of IPV and child maltreatment

- In **30-60%** of American families living with IPV, CA/N also existed (Edleson, 1999)
- **50-66%** of Australian child protection cases involve IPV (Humphreys, 2007)
- **75%** of children where serious child maltreatment was recorded were living with IPV, parental mental health or drug abuse issues (UK Serious Child Maltreatment Reviews)
- More than **1/3** of youth who witnessed IPV had also been maltreated in the past year, compared with 8.6% of non-witnesses (US National Survey of Children's exposure to violence (NatSCEV), 2010)

Conceptual models

Conceptualising “risk” and “protection”

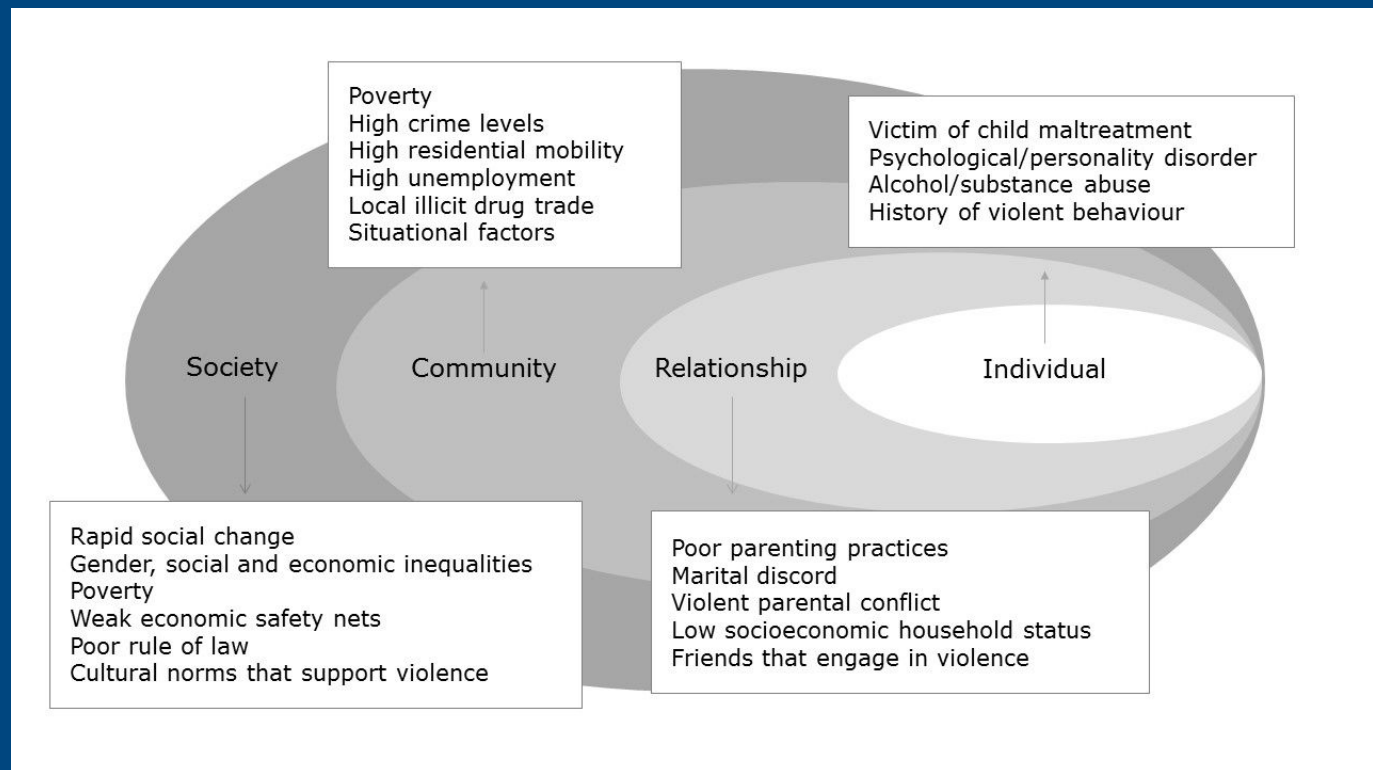

How we understand the factors that influence violence experience is determined by the width of our field of vision.

Conceptual models expand our understanding of the community and societal factors that influence violence experience

Conceptual models

World Health Organisation: Violence Prevention Alliance

Expanded ecological model

Heise, Lori L. (2011) *What works to prevent partner violence: An evidence overview.*

Gender order

- Lack of economic rights & entitlements for women
- Discriminatory family law
- Ease of divorce for women
- Composite measures of gender inequality

Cultural factors

- Collectivist vs individual cultural orientation
- Emphasis on women's purity and family honour

Economic factors

- Level of development
- Women's access to formal wage employment

Norms

- Acceptance of wife beating
- Male right to discipline / control female behaviour
- Tolerance of harsh physical punishment of children
- Stigma for divorced or single women
- Norms linking male honour to female purity
- Family privacy

Lack of sanctions

- Lack of legal / moral sanctions for violence
- Others do not intervene

Neighbourhood

- Community violence
- High unemployment
- Low social capital
- Poverty

Violence in childhood

- Harsh physical punishment
- Witnessing parental violence
- Other childhood traumas
- Psychological dysfunction
- Antisocial behaviour
- Adult attachment issues

Attitudes

- Accepting of violence as a means to resolve conflict
- Acceptance of partner violence
- Gender hierarchical attitudes

Alcohol abuse

Gender role conflict

Delinquent peers

Socio-demographic

- Young
- Low educational level

Interaction

- Non-equalitarian decision making
- Poor communication
- High relationship conflict

Conflict arenas

Situational triggers

- Sex / infidelity
- Money / resources
- Children or in-laws
- Division of labour
- Male drinking

triggers

- Female challenge male authority
- Failure to meet gender role expectations
- Assertions of female autonomy

Childhood violence

- Child sexual abuse
- Other childhood traumas
- Witnessing mother being

Attitudes

- Tolerance of wife beating
- Socio-demographic
- Young age
- High educational attainment (protective)

Low social support

Colonisation & violence experience

Smith, Family Violence Death Review Committee. Restorative Justice Conference: Family violence, the law and restorative justice; 2015; Wellington, New Zealand

Cumulative patterns of harm

Historical trauma and structural violence

1st Generation: Conquered males were killed, imprisoned, enslaved

2nd Generation: Many men overused alcohol and/or drugs to cope with their resultant loss of cultural identity and diminished sense of self-worth.

3rd Generation: The intergenerational effects of violence manifest in the increased prevalence of spousal abuse and other forms of domestic violence. The breakdown in the family unit that accompanied this violence 'required' caring governments of the day to remove 'at risk' children from their mothers and place them in the care of suitable, in many cases non-Indigenous, families.

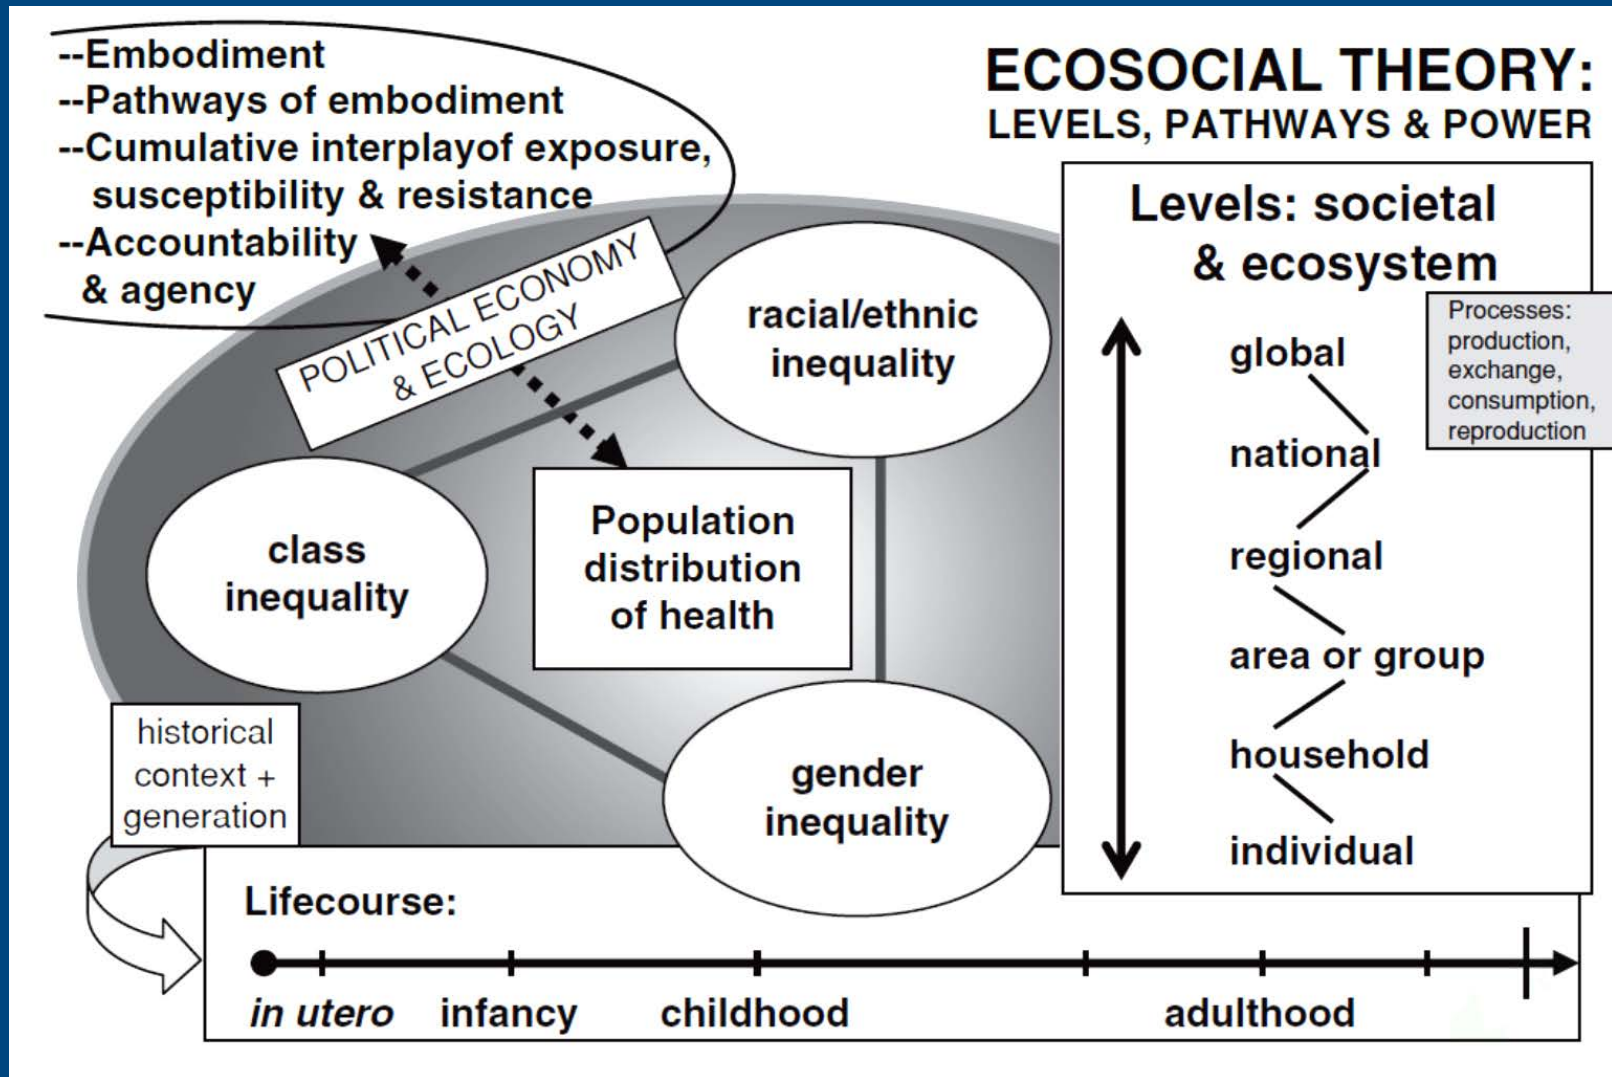

4th Generation: Trauma begins to be re-enacted and directed at the spouse and the child; signifying a serious challenge to family unit and societal norms of accepted behaviour.

5th Generation: In this generation, the cycle of violence is repeated and compounded, as trauma begets violence, with trauma enacted through increasingly severe violence and increasing societal distress.

Judy Atkinson. 2002. *Trauma Trails – Recreating Songlines: The transgenerational effects of Trauma in Indigenous Australia*. Spinifex Press, North Melbourne.

Hosking, J., Ameratunga, S., Morton, S., and Danilo Blank. A life course approach to injury prevention: a "lens and telescope" conceptual model *BMC Public Health* 2011, 11:695.

Measuring risk and protective factors

Cross-sectional studies

Strengths:

Consistent methodology applied (WHO, DHS)

Cost effective

Self-report of experience and impact

Limitations:

Recall

Cohort studies

Life-course

Cohort
recruitment

Outcome
measurement

Strengths:

Measure risk and protective factors before the outcome

Less subject to recall

Limitations:

Cost

Key measures may not be incorporated at the start of the study

Challenges involved with measurement

- Not all risk / protective factors, components of violence, or outcomes of violence exposure can be adequately measured. For example:
 - Controlling behaviours – context specific
 - Social norms – social acceptability of responses
- Direction of causality may be difficult to determine
 - Which came first?

- Have tended to focus on risk / protective factors born by the woman and/or her partner, not community or macrosocial

Prior to relationship

- Respondent and partner
 - Abused as a child ↑
 - Father hit mother ↑
- Respondent
 - Physically abused when over 15 years of age ↑
 - Sexually abused when over 15 years of age ↑

Current Situation

- Household income >\$NZ75,000 ↓
- Both employed ↓
- Problem drinking Respondent and partner ↑
- Partner
 - Has concurrent relationships ↑
 - Is violent to others ↑

So what does this mean for preventing violence?

**Take
home message*

1. Single factor solutions will never solve the problem of violence

- Violence is the outcome of the interaction of many different factors.
- Individual, relationship, community, social and cultural factors work together to enhance or reduce the likelihood of violence being perpetrated or experienced.
- Violence is a behaviour which is governed by choice.

2. We know enough to act NOW

CDC Technical Packages for Violence Prevention:

A technical package has three parts.

- **The strategy:** the direction or actions to achieve the goal of preventing violence.
- **The approach:** specific ways to advance the strategy - programs, policies, and practices.
- **The evidence:** for each approach

These are living documents

3. A comprehensive approach is required

All levels of Heise's
expanded ecological model
need to be addressed

Societal

- Strategic policy development
- Address structural inequalities
- Effective infrastructure
- Long-term funding

Community

- Social marketing campaigns
- Community development
- Enhanced Maori social capability
- Improved judicial response
- Enhance social capital

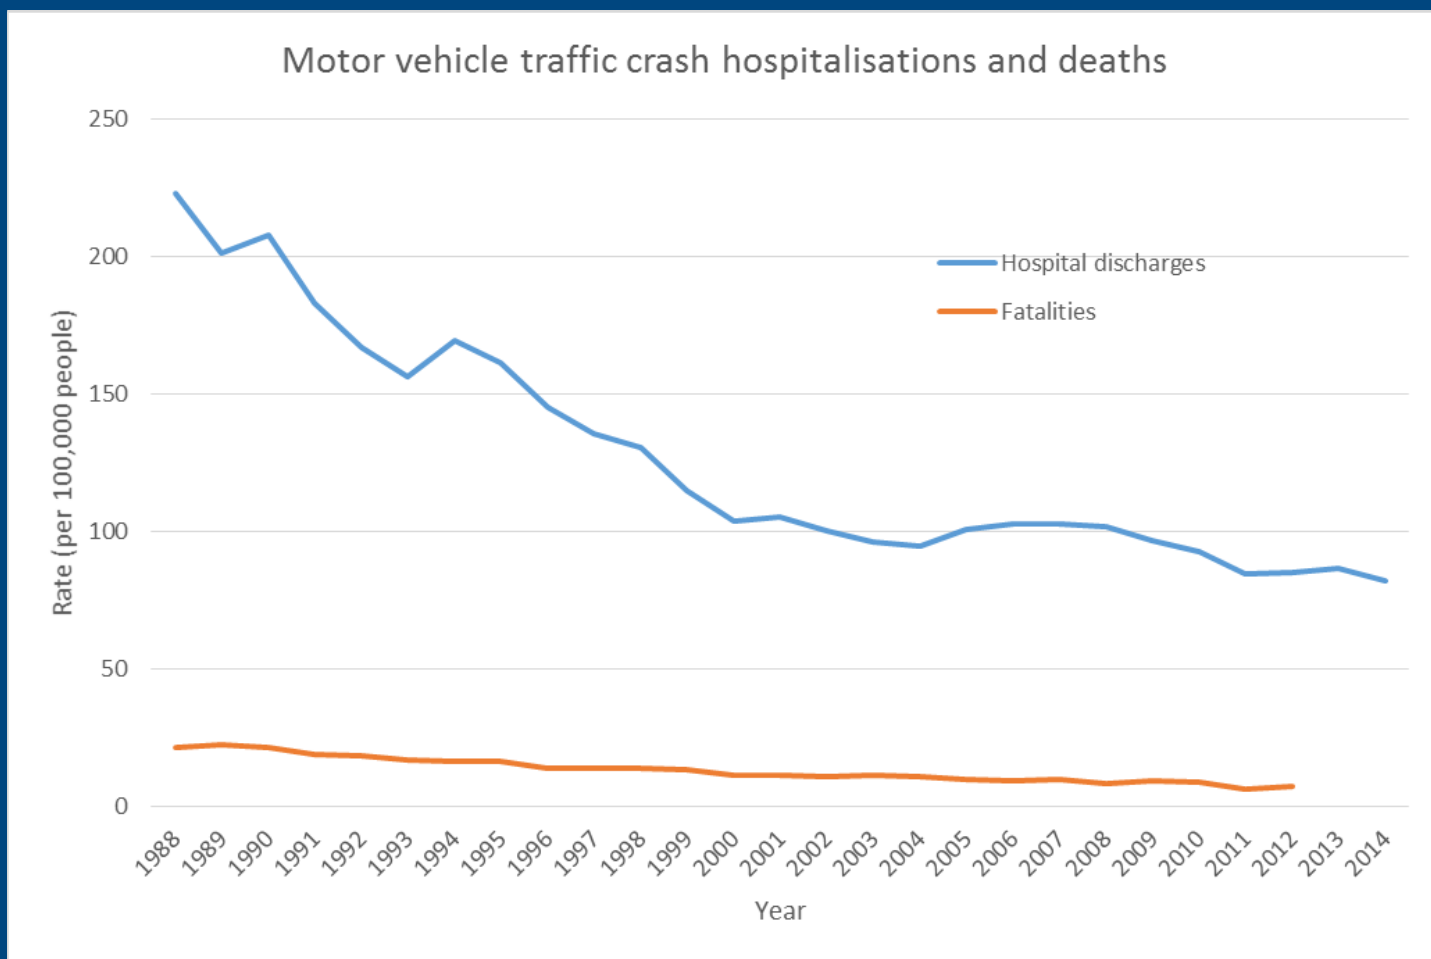

Male / female partner

- Address violence experience in childhood
- Develop pro-social behaviours
- Effective role models
- Reduce social acceptability of binge drinking
- Improve social connectedness

Relationship

- Acceptable and available relationship counselling
- Relationship skill development in adolescence
- Resilient whānau

4. We can learn from other health / social problems

What has it taken to bring the road toll down?

- Ministry of Transport
- Effective social marketing campaigns to change social norms
- Improved roading infrastructure
- Legislation to reduce risk – increasing the age of licensure and making drinking and driving illegal
- Swift and sure punishment where laws were broken (booze buses, demerit points, speed cameras)
- Increased activity at high risk times to enforce legislation.

On-going surveillance;
Continual learning;
Willingness to adapt and improve;
Long-term investment

5. We can learn from other communities

- Community mobilisation intervention to prevent violence against women.
- Randomised controlled trial, followed-up 4 years post intervention
- Past year physical IPV reduced by over half
- Results highlight the important role of community-level norm change
- Strong support for community level approaches for preventing violence

The last word

CDC:

“Everyone is benefited by a lifetime of healthy positive relationships”

START EARLY

Healthy parent-child relationships, positive family dynamics, and supportive communities provide a strong foundation for children.

EFFECTIVE, non-violent communication and conflict RESOLUTION

POSITIVE interactions based on respect and TRUST

CONTINUE THROUGH ADOLESCENCE

Positive, healthy teen dating and peer relationships have many benefits for youth.

REDUCED anti-social and unhealthy behaviors

BETTER interpersonal skills, communication, negotiation skills, and EMPATHY

POSITIVE self-image and leadership skills

IMPROVED school performance

CARRY INTO ADULthood

Healthy adult relationships benefit entire communities.

More ENGAGED citizens

More PRODUCTIVE workforce

SAFER communities

LESS partner violence

More ATTENTIVE students in schools
